

TALENT DEVELOPMENT · COMPETENCY MODELING

Skills-based growth, made decision-ready.

A governed L&D planning system connecting workforce proficiency, talent calibration, individual development plans, and four-level learning evidence for 70 synthetic employees.

O*NET 31.0

Kirkpatrick L1–L4

9-box calibration

81.4%

workforce mastery

58

active development plans

14

Star Talent records

₹4.8Lsynthetic quarterly savings
association

Decision promise: target verified capability gaps first, keep nine-box placement reviewable, and connect learning activity to evidence without overstating causation.

TALENT GROWTH WORKFLOW

From capability demand to verified development.

1

Define the ontology

Twenty O*NET 31.0-aligned competencies set proficiency targets, evidence standards, categories, and accountable departments.

2

Assess the workforce

Seventy profiles hold technical, compliance, leadership, overall mastery, and mean-gap signals.

3

Calibrate talent

Performance and potential inform a nine-box review prompt; placement does not automate employment decisions.

4

Build the IDP

Each plan links a target competency, development action, mentor, hours, and 30/60/90-day milestones.

5

Evaluate evidence

Kirkpatrick levels separate reaction, learning, behavior, and results so different claims are not collapsed.

GOVERNED LEARNING CHAIN

Each level answers a different question.

L1 • Reaction

4.6 / 5 synthetic mean: did participants find the learning relevant and usable?

L2 • Learning

88.6% synthetic mean: what aligned knowledge or skill evidence changed?

L3 • Behavior

81.4% aggregate mastery signal with 46 verified records: is learning visible in work?

L4 • Results

+24.6% yield, -18.2% scrap, and ₹4.8 lakhs savings: what cohort outcome moved?

Capability gap

Current proficiency 3.64 versus target 4.12 gives a governed mean gap of -0.48.

Portfolio shape

Technical, compliance, and leadership mastery stay visible alongside the aggregate.

Interpretation control: L4 values are a synthetic cohort association. They do not prove that the learning program caused the operational result.

RESPONSIBLE TALENT OPERATIONS

Development data needs the same discipline as core HR data.

- **Nine-box guardrail:** placement supports calibration discussion; it is not a promotion, termination, or succession decision.
- **Evidence standard:** every competency defines what observable work demonstrates proficiency.
- **IDP accountability:** learner, manager, mentor, L&D, and HRIS roles are separated through a 20-point RACI.
- **Role-based access:** profile, plan, assessment, and reporting permissions follow purpose and least privilege.
- **Provenance:** O*NET 31.0 references are disclosed under CC BY 4.0; local competency design remains explicit.
- **Privacy:** every employee identity and result is synthetic, cohort reporting is preferred, and real performance decisions are out of scope.

Built deliverables: competency, employee, and IDP datasets; ontology; Kirkpatrick model; nine-box guide; RACI; LMS workflow; privacy matrix; UAT; dashboard; and deck.

EXECUTIVE TAKEAWAY

Capability planning becomes useful when evidence reaches the work.

What leaders can decide

Which capability gaps create the most operational exposure and where development capacity should go first.

What L&D can run

Targeted learning portfolios, mentor-supported IDPs, milestone reviews, and evidence collection across four levels.

What managers can coach

Specific target competencies, observed gaps, development actions, and time-bound work evidence.

What the model does not claim

No causal ROI proof, no automated talent decision, no psychometric validation, and no production deployment.

The practical advantage is a traceable chain from business capability demand to competency definition, worker gap, development action, evidence, and review.
