

INDEPENDENT HR ANALYTICS PORTFOLIO CASE

UAE Workforce Planning and Total Rewards

A decision-focused case connecting workforce planning, total rewards, recruitment, and scenario modelling.

Mohammad Azimuddin

August 2026

SYNTHETIC DATA DISCLOSURE

All company, employee, salary, recruitment, and scenario data in this document is fictional. Results demonstrate an analytical process, not employer outcomes or UAE market benchmarks.

Business question

How should a fictional UAE services company allocate its people budget to balance retention, fair-pay review, recruitment demand, and planned growth?

The analysis compares three choices:

1. Continue the current baseline.
2. Invest selectively in pay corrections and manager support.
3. Accelerate growth hiring while accepting unchanged turnover.

Dataset and controls

Component	Synthetic scope
Employee records	650
Active employee records	538
Hypothetical salary bands	24
Workforce history	24 months x 6 departments
Recruitment requisitions	48
Workforce scenarios	3

The data package includes unique-ID checks, salary-band relationship checks, monthly opening-to-closing headcount reconciliation, recruitment-funnel checks, and status/exit-date validation. The July closing headcount reconciles to 538 active employee records.

Descriptive findings

Workforce

- Trailing-12-month exits: **57**.
- Average monthly closing headcount: **516.2**.
- Turnover: **11.0%**.
- Annualised synthetic base payroll: **AED 83,076,000**.

Total rewards

- Active records below a 0.90 compa-ratio: **81**.
- Illustrative annual correction to 0.90: **AED 464,400**.
- The displayed gender pay gap is raw and unadjusted. It cannot establish unfair treatment or discrimination.

Recruitment

- Closed requisitions: **42**.
- Offer-acceptance rate: **43.3%**.
- Average time-to-fill: **56.8 days**.

These findings are descriptive. They identify questions for investigation; they do not establish why employees leave or how a real workforce would respond.

Scenario comparison

Scenario	Expected exits	Total hires required	Projected people cost	Year-end headcount
Baseline	59	95	AED 88,588,663	574
Targeted Retention	50	86	AED 88,936,138	574
Growth-First	59	131	AED 91,548,151	610

The Targeted Retention scenario assumes a 15% reduction in exits. It reduces required hires by 9, but its projected people cost is AED 347,475 above baseline because the intervention costs more than the modelled avoided replacement cost.

Recommendation

Do not approve a broad intervention from this dashboard alone. Run a controlled 90-day validation phase:

1. Review low compa-ratio cases within consistent job families and levels.
2. Validate exit reasons and regrettable-exit definitions.
3. Replace the 30% replacement-cost assumption with Finance-approved inputs.
4. Define a limited manager-support pilot and success measures.
5. Recalculate the scenario before any wider decision.

Limitations

- All records and results are synthetic.
- Salary bands are hypothetical and are not UAE labour-market benchmarks.
- The raw pay gap does not control for level, tenure, job family, performance, or location.
- The model excludes allowances, incentives, benefits, visa costs, end-of-service benefits, and accounting timing.
- The 15% retention effect and 30% replacement-cost factor are assumptions, not forecasts.
- Protected characteristics must never drive individual employment decisions.

What this project demonstrates

Workforce-movement reconciliation | HR metric definition | compa-ratio interpretation | recruitment-funnel analysis
| assumption-led scenario modelling | data-quality controls | ethical limitation writing | executive data storytelling
